Organization Feedback

Thank you for sharing your self-assessment findings. The overall Cyber Hygiene Score of 50% indicates that there are significant opportunities for improvement to strengthen your organization's cybersecurity posture. It is critical to prioritize enforcing Multi-Factor Authentication (MFA) for all critical systems, as this provides an essential layer of security beyond passwords. Similarly, implementing and regularly reviewing strong password policies will enhance account security. Deactivating inactive or terminated employee accounts immediately and adhering strictly to the least privilege principle is essential to prevent unauthorized access and potential data breaches. To ensure data integrity and availability, I recommend establishing a robust data backup and recovery process with regular backups, and introduce formalized data classification to protect sensitive information.

I advise implementing a centralized system for managing software and conducting regular vulnerability scans to identify and mitigate potential threats. Strengthening your encryption practices for sensitive data both at rest and in transit is also crucial. Boost employee preparedness through comprehensive cybersecurity awareness training, including simulated phishing attacks and role-specific programs. Finally, establishing a clear and accessible reporting mechanism for security incidents will facilitate quicker responses and remediation. Assign dedicated timelines and responsibilities for each recommendation to ensure progress. Taking these steps will significantly enhance your organization's resilience against cyber threats.
